Dawn Solar

**SOLAR SYSTEM DESIGNED TO ELIMINATE EYESORE OF SOLAR COLLECTORS**

The Dawn Solar System was created specifically to eliminate the visible eyesore of solar collectors. The system absorbs heat generated by the sun shining on a roof (or wall) into a concealed, patent-pending thermal collector from which it delivers heating, cooling and hot water. Because it is hidden, it is also protected from the elements, which extends product life. Dawn Solar thermal systems use solar energy to heat water for domestic hot water, radiant heating and space heating, while reducing cooling costs as heat is transferred from the roof. Depending upon climate, location and application design, a Dawn Solar system pumps solar-heated fluids through conventional heat transfer and distribution systems. In warmer weather, the Dawn Solar System also 'air conditions' sulting in energy savings on cooling costs. When combined with photovoltaic (laminates or PV roof tiles), these systems can generate electric energy from the same space. Systems are pre-engineered for each tion and are easy to install.
